Hageiris fra 1800-tallet:

Til venstre Iris 'Gracchus' (Ware 1884) – til høyre en ukjent sort som ligger nær Iris sambucina.

Iris x germanica

Til venstre: Iris 'Jane Phillips' (Graves, USA 1950)
 Til højre: Iris 'Annabel Jane' (Dodsworth, UK 1973)

26 TALL BEARDED IRISES

Jane Phillips

Pale irises are incredibly versatile, as they blend well with many other perennials. Of all the soft bluish-lilac varieties grown in the UK today, this is still the most popular. Distinctly old-fashioned, this classical iris has crêpe-paper-like petals lined with veins of deeper colour. The white beard sits on falls that hang gracefully downwards. Some might consider this an unattractive trait, but when the blooms are fully open they form an elegant flower spike. The whole plant is disease resistant and very tough, with handsome grey-green leaves. As a parent plant, it is of historical importance. Many of its progeny, which include Sapphire Hills (see page 37), are award-winning varieties. It was introduced by Dr Robert Graves, who served as a doctor in World War I.

Breeder: Graves, USA
Year of introduction: 1950
Flowering height: 90cm (36in)
Flowering period: Mid-season
Similar varieties: Blue Rhythm, Derwentwater, Great Lakes, Harbor Blue

Annabel Jane

Brian Dodsworth, the most prolific breeder of Tall Bearded irises in the UK today, named this elegant variety after his daughter. It is perhaps his finest achievement, producing heavily ruffled flowers of smooth lilac with a short orange beard sitting on the falls. The flowers have a light, spicy scent and are borne in great profusion. They are poised perfectly on very tall stems above a clump of leaves that is exceptionally healthy. Despite being tall, this variety remains remarkably upright even on very windy days. It is excellent for placing at the back of a border among other perennials.

Breeder: Dodsworth, UK
Year of introduction: 1973
Flowering height: 105cm (41in)
Flowering period: Mid-season
Awards: DM (UK) 1977
Similar varieties: Mary Frances

En typisk moderne hageiris

Latin Rock

The colours of many modern bearded irises are not to be found in older hybrids. These were only produced in primary and secondary colours; some were a muddy blend of both and looked as if the artist had failed to wash the paintbrush between each application of colour. As a result, they blended well with other flowers and never dominated the garden. Modern varieties such as this one can be extremely 'individual' and difficult to incorporate among other plants. In colour, Latin Rock is exotic. Its standards are peach-pink washed with soft purple, and the falls are a velvety pink-plum flushed with magenta. This is a large, ruffled, beautifully proportioned flower that is sweetly scented.

Breeder: Schreiner, USA

Year of introduction: 1984

Flowering height: 90cm (36in)

Flowering period: Early to mid-season

Similar varieties: Jazzed Up
